C0.1

(C0.1) Give a general description and introduction to your organization.

Anheuser-Busch InBev is a publicly traded company (Euronext: ABI) based in Leuven, Belgium, with secondary listings on the Mexico (MEXBOL: ANB) and South Africa (JSE: ANH) stock exchanges and with American Depositary Receipts on the New York Stock Exchange (NYSE: BUD). We are the world’s leading brewer and everything we do is driven by our dream of bringing people together for a better world. Beer, the original social network, has been bringing people together for thousands of years. We are a strong, diversified company with an unrivaled geographic footprint, portfolio of brands, talent pool, and clear commercial strategy, committed to building great brands that stand the test of time and to brewing the best beers using the finest natural ingredients. Our diverse portfolio of well over 500 beer brands includes global brands Budweiser®, Corona® and Stella Artois®; multi-country brands Beck’s®, Castle®, Castle Lite®, Hoegaarden® and Leffe®; and local champions such as Aguila®, Antarctica®, Bud Light®, Brahma®, Casis®, Chef’s®, Chimay®, Cristal®, Harbin®, Jupiler®, Klinskoye®, Michelob Ultra®, Modelo Especial®, Quilmes®, Victoria®, Sedrin®, Sibirskaya Korona® and Skol®. Our brewing heritage dates back more than 600 years, spanning continents and generations. From our European roots at the Den Hoorn brewery in Leuven, Belgium; to the pioneering spirit of the Anheuser & Co. brewery in St. Louis, US; to the creation of the Castle Brewery in South Africa during the Johannesburg gold rush; to Bohemia, the first brewery in Brazil. We pride our geographical diversity and balanced exposure within developed and developing markets, leveraging the collective strengths of approximately 200,000 employees based in more than 50 countries worldwide. For 2019, AB InBev’s reported revenue was 52.3 billion US dollars (excluding joint ventures and associates) growing volumes by 1.1%, our third consecutive year of volume growth with the rate of growth accelerating each year.

<td>Yes [Consumption only]</td>
</tr>
</tbody>
</table>

C-AC0.6f/C-FB0.6f/C-PF0.6f
Why are emissions from distribution activities within your direct operations not relevant to your current CDP climate change disclosure?

Row 1

Primary reason
Evaluated but judged to be unimportant

Please explain
Both our upstream raw materials and downstream distribution are procured through leasing agreements with third party suppliers where we do not have operational control. Because of this, we track and measure both emissions coming from our distribution activities, both upstream and downstream, which make up a portion of our Scope 3 emissions and would be recognized as elsewhere in our value chain as downstream and upstream activities.

C-AC0.7/C-FB0.7/C-PF0.7

Which agricultural commodity(ies) that your organization produces and/or sources are the most significant to your business by revenue? Select up to five.

<table>
<thead>
<tr>
<th>Agricultural commodity</th>
<th>% of revenue dependent on this agricultural commodity</th>
<th>Produced or sourced</th>
<th>Please explain</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rice</td>
<td>10-20%</td>
<td>Sourced</td>
<td>Rice is one of the key agricultural commodities used in the production of many of the iconic brands at Anheuser-Busch InBev, including Budweiser, Bud Light and Michelob Ultra among many others. It makes up the majority of GHG emissions coming from agriculture (more than 60%) and around 10% of our revenues. In order to estimate this value, we included the commodity purchases in relation to total revenues coming from brands that utilize this commodity.</td>
</tr>
<tr>
<td>Other, please specify (Barley)</td>
<td>60-80%</td>
<td>Sourced</td>
<td>Barley is the most critical agricultural commodity for brewing beer and AB InBev is the world’s largest purchaser of malted barley. All iconic Anheuser-Busch InBev brands utilize barley on their recipes including brands like Budweiser, Stella Artois, and Corona. We are committed to sourcing sustainable barley and we have a research center in Ft Collins, CO in the United States dedicated to breeding varieties that will be resilient in the future. Percent of revenue dependent on barley was estimated by adding the commodity purchases in relation to total revenues coming from brands that utilize this commodity. Approximately 70% of our revenue depends on barley.</td>
</tr>
<tr>
<td>Other, please specify (Maize)</td>
<td>10-20%</td>
<td>Sourced</td>
<td>Maize is one of the key agricultural commodities used in the production of many of the iconic brands at Anheuser-Busch InBev, including Stella Artois and Corona among many others. It makes around 15% of our revenues. In order to estimate this value, we included revenues coming from brands that utilize this commodity</td>
</tr>
<tr>
<td>Wheat</td>
<td>Less than 10%</td>
<td>Sourced</td>
<td>Wheat is one of the agricultural commodities we use to brew specialty beers such as Hoegaarden. It makes less than 5% of our revenues. In order to estimate this value, we included spent of that particular commodity in relation to revenues coming from brands that utilize this commodity</td>

C1. Governance

C1.1
(C1.1) Is there board-level oversight of climate-related issues within your organization?

Yes

(C1.1a) Identify the position(s) (do not include any names) of the individual(s) on the board with responsibility for climate-related issues.

<table>
<thead>
<tr>
<th>Position of individual(s)</th>
<th>Please explain</th>
</tr>
</thead>
<tbody>
<tr>
<td>Board-level committee</td>
<td>The Finance Committee (a Board-level committee of the Board of Directors) oversees legal and regulatory affairs as well as environmental and social responsibilities. In 2019 they met four times. The Finance Committee is composed of non-executive Board members, with at least one member qualifying as an independent director. The Committee oversees and approves the company’s Sustainability Goals and commitments, including those related to climate change. One of the Sustainability Goals overseen is the commitment to reduce ABI emissions by 25% across our value chain (Scopes 1, 2, and 3) as well as an absolute emission reduction of 35% in Scopes 1 and 2 by 2025 from a 2017 baseline. As climate is a top priority on their agenda, issues such as crop yield in Barley and implementation of Smart Barley across the world are discussed and approved during the Committee’s meeting. In 2019, topics discussed specifically were risk of barley yield losses due to climate change and physical risks such as water risk in geographies such as South America, where the majority of our business lies within. These discussions resulted in the Board of Director’s decision to increase funding towards mitigating the identified transition risks related to supply chain that may occur within the supply chain due to climate change. By performing climate scenarios, we are able to predict plausible crop yield loss in function of a Representative Concentration Pathway as per IPCC standards.</td>
</tr>
</tbody>
</table>

(C1.1b) Provide further details on the board’s oversight of climate-related issues.

</tr>
</tbody>
</table>
C1.2a) Describe where in the organizational structure this/these position(s) and/or committees lie, what their associated responsibilities are, and how climate-related issues are monitored (do not include the names of individuals).

While the Chief Procurement and Sustainability Officer has full accountability for Sustainability, the Sustainability Council has the highest level of direct responsibility for climate change within AB InBev, and is comprised of the following C-Suite officers: Chief Sustainability and Procurement Officer (CSO), Chief Legal and Corporate Affairs Officer, Chief Supply Officer, and Chief Marketing Officer. These positions were chosen to oversee climate-related issues due to their leadership within operations that manage and interact with climate-related issues. The CSO is responsible for full developing and overseeing the full AB InBev sustainability agenda as well as leading the Sustainability Council; reporting directly to Chief Executive Officer (CEO). In addition, the CSO oversees procurement operations, ensuring full engagement with our supply chain partners on sustainable initiatives throughout the value chain process. Through leading procurement operations, the CSO focuses on supplier partnerships targeted towards carbon footprint reductions across the supply chain. Working in collaboration with our suppliers is key in order to reduce emissions, such as working with suppliers to switch to alternative fuels at their sites, increasing recycled content, and assisting in piloting novel solutions that could reduce energy usage. Some recent examples of this includes the design of new packaging materials and implementing recycling partnerships in markets like Brazil and Colombia. The Chief Legal and Corporate Affairs Officer (CLO) oversees company-wide policies, including those specifically targeted to address climate-related risks, such as transition risks. The CLO is responsible and accountable for the AB InBev Smart Drinking and Road Safety and well as Product Labelling agenda, which is further overseen by the council. The Chief Supply Officer oversees emission reduction programs for direct operations and indirect supply chain logistics. In addition they are responsible for developing and implementing climate-related innovations within the company, such as multi step-boiling and the design of a Net-zero brewery. The Chief Supply Officer works with the Chief Marketing Officer (CMO) to innovate more sustainable products in line with consumer studies. The CMO works to bring consumer insights into innovation considerations while further working to sustainability market AB InBev products.

The Sustainability Council was created to guarantee execution of all sustainability matters taking into account how company compensation is structured, to cascade sustainability targets from the highest level of the organization to all operating units. This plan encompasses the organization's work to establish a greenhouse gas strategy that includes setting emission reduction targets and measuring progress, as well as setting goals and measuring progress around water stewardship, smart agriculture, climate action, renewable energy, circular packaging, and other climate-related activities. The Council monitors and reports progress towards the AB InBev 2025 Sustainability Goals (SGs) at least twice a year to the full Board of Directors; in 2019 the Council met 4 times. Progress towards goals is assessed through clear targets aligned with the 2025 SGs for each member that include key performance indicators (KPIs) related to achievements. Individual and council-level progress is tracked through a comprehensive sustainability dashboard. Examples of goals tracked include percent renewables utilized, and emission reductions within Scope 1, Scope 2, and Scope 3 emissions. Individual annual performance reviews are tied to these goals which directly effects compensation.

C1.3

(C1.3) Do you provide incentives for the management of climate-related issues, including the attainment of targets?

<table>
<thead>
<tr>
<th>Provide incentives for the management of climate-related issues</th>
<th>Comment</th>

<td>Other, please specify (Employees)</td>
<td>Monetary reward</td>
<td>Energy reduction target</td>
<td>In some regions in which we operate, plant employees are eligible to receive monetary rewards for achieving performance targets that include energy and greenhouse gas targets as well as other climate-related targets. These incentives are directly tied to individual employee roles and responsibilities.</td>
</tr>
<tr>
<td>Other, please specify (Various groups and individual employees)</td>
<td>Monetary reward</td>
<td>Energy reduction target</td>
<td>Various roles and individual employee assignments are responsible for goals that can directly impact energy reduction performance. As an example, barley experts are rewarded for the agricultural development goal, and packaging experts for the packaging reduction goal. Responsibility for these role-related goals are cascaded throughout the organization. This approach reflects functional integration that we believe will yield long-lasting and achievable results.</td>
</tr>
</tbody>
</table>

C2.1 Risks and opportunities
(C2.1b) How does your organization define substantive financial or strategic impact on your business?

The substantive financial or strategic impact of climate-related risks and opportunities are identified using climate-scenarios and measuring impacts across our value chain in a matrix that measures financial impact (low-medium-high) and uncertainty of the event happening (Certain-Medium-Highly Uncertain). Highly uncertain plausible events that have the highest impact on the business (in millions of dollars) are given the highest punctuation. Uncertainty is measured on a scale of 0 to 1.

A substantive impact is referred to as a significant impact, which is defined as an event that has a net financial impact of greater than 3% over that facility and/or supply chain (commodities). This value varies for our direct operations as it is directly correlated to the net revenue of that specific facility. For supply chain risk, this impact is measured as 3% of overall net revenue dependent on that specific commodity. For example, in the case of barley, this is approximately equivalent to 1 million of dollars in impact. This exercise is executed by the Sustainability Team, which is led by the VP of Sustainability, and presented on an annual basis to both the Sustainability Council and Risk Management team.

In addition to this quantifiable financial impact indicator, we have leveraged our key performance indicators for our company and beverage supply chain to measure substantive change in various climate-related metrics to manage and reduce the likelihood of negative impacts from climate change from occurring. Our goals are set at a level which measures substantive change for our company. The indicators are:

1. By 2025 - The company has published a public goal to measurably improve water availability and quality in high risk watersheds. In each of the high-risk watersheds, specific targets and goals are being set based on the relevant local water risks and priority response areas.

2. By 2025 – Source 100% of our purchased electricity from renewable sources and reduce our carbon emissions by 25% across our value chain. By the end of 2019, we were 61% towards the goal of 100% renewable purchased electricity and have reduced our Scope 1 and 2 emissions by 13.27% in absolute value and 19.06% in intensity (kgCO2e/hl) from our 2017 baseline.

In addition, facility-level goals are developed in alignment with corporate indicators. Goals drive our performance, and the collaborative process we use to set these targets helps ensure success. All levels of our organization are aligned on this approach and intensely focused on achieving set goals.

AB InBev defines a substantive change as a risk that has a net financial impact of no less than 3% of the overall EBITDA of the facility. Once exposed, these financial risks are then fed into the broader group-wide risk assessment reporting system. Most material risks will be addressed by adequate mitigation actions for which appropriate CAPEX and OPEX may be required. This definition of substantive change is applied to both our direct operations and our supply chain.

(C2.2a) Which risk types are considered in your organization’s climate-related risk assessments?

<table>
<thead>
<tr>
<th>Risk type</th>
<th>Relevance &amp; inclusion</th>
<th>Please explain</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current regulation</td>
<td>Relevant, always included</td>
<td>Current regulation is constantly assessed at all levels as part of the climate-related risks using TCFD recommendations. We work closely with our legal advisors in every country our operations are within across the world, evaluating current regulations and the resulting risk and opportunities we experience. Based on this, we make strategic decisions on investments and plans to address current regulation risks. An example of a risk of this type is carbon taxation in countries within the EU, where current regulation impacts 5% of our facilities. To address this we are accelerating our decarbonization in those facilities. We identified additional facilities that could potentially be included in the expansion of the EU ETS and the Green New Deal, and part of the mitigation plan include accelerating our decarbonization in these facilities, potential new facilities that could be impacted, and finally, all facilities across the Pan-European countries. In total we have identified more than 6 million USD of carbon tax saved in logistics through implemented distance reduction projects across the world. Across the business we assess risks and opportunities related to current regulations.</td>
</tr>
<tr>
<td>Emerging regulation</td>
<td>Relevant, always included</td>
<td>We evaluate emerging regulation of every country our operations are within on a regular basis using TCFD recommendations to influence our strategic decisions on investments and plans. Emerging regulations are part of transitions risks and may impact our direct operations and costs of materials (such as packaging materials) and logistic. The risk of emerging policies is evaluated based on possible future scenarios such as the current policies scenario and sustainable development scenario from IEA in the World Energy Outlook 2019. An example of a risk of this type is we identified additional facilities within the EU that could potentially be included in the expansion of the EU ETS; part of the mitigation plan now includes accelerating our decarbonization in these facilities. We have also identified possible impacts in Mexico that will be implemented starting 2030. This emerging trading scheme could potentially impact at least 4% of our current facilities in the Middle Americas Zone.</td>
</tr>
<tr>
<td>Technology</td>
<td>Relevant, always included</td>
<td>When making strategic decisions based on our short- and medium-term strategy we include technology for the risk assessment. An example of a risk of this type is that as a company we face the risk of additional implied costs related to obsolete technology which could result in increased taxes from fossil-fuel-based technologies. In order to address this, we continuously work on piloting and implementing innovative solution that are lower carbon or carbon-free. For development of new products we take into account technology that mitigates the use of energy and water overall and through LCAs, assess carbon footprint of new products being developed. In addition to this, we also use our +100 Accelerator to identify start-ups across the world that have developed unique technologies that are able to be scaled and implemented across our operations. An example of one of the Accelerator start-ups is Yushuo. Yushuo proposes a solution by reusing old batteries from electric vehicles to store electricity on our on-site installations in China. Renewable electricity usage went from 20 to almost 30% in those facilities. The development of new technologies mitigates our risk of future possible scenarios evaluated on our risk assessment process.</td>
</tr>
<tr>
<td>Legal</td>
<td>Relevant, always included</td>
<td>The legal aspect is always evaluated before making any climate-related decision. An example of a risk of this type is that Transition risks due to legal issues can impact our supply chain, impacting negatively cost of input such as packaging materials; regulation such as the EU ETS that can impact directly our operations as it regards enforcing efficiency and accelerated decarbonization strategies; risks associated with fuel transition which would impact the cost of moving our finish products. An example on how we currently address this risk type is the switch from coal to natural gas in China and initiatives addressing carbon tax implemented in several countries in the last years. This risk type is included in climate-related risk assessments through continuous assessments as projects emerge throughout the year. Legality is assessed by the innovation group and also by the supply team, more specifically energy and environment teams across the world. As a global company, we are impacted by these regulations all over the world.</td>
</tr>
<tr>
<td>Market</td>
<td>Relevant, always included</td>
<td>Market trends are the base of our business and our main client is the consumer. We evaluate market trends on strategic planning within sustainability. Market risks are included in our risk assessment processes through following market trends to help us predict what future behaviors will be and how the will market shape. An example of a risk of this type includes current trends on how packaging is used to market certain information to the customer, a process that is done once a year during the 3- and 10-year planning sessions. As volume is predicted, so is the impact on the environment as type of packaging affects overall carbon footprint. In addition to this, consumer preference towards purpose-driven products is evaluated. An example of this is how we included our RE100 initiative into our packaging, communicating to consumers how Budweiser is brewed with 100% renewable electricity as each market reaches the commitment. Another example is Michelob Ultra in the United States. Michelob Ultra committed to transform 1 square foot of regular barley land into organic barley land for every case sold. This commitment addresses consumer demand of more purpose-driven products.</td>
</tr>
<tr>
<td>Reputation</td>
<td>Relevant, always included</td>
<td>Our reputation is key for the future success of our business as it directly impacts license to operate. Strategic decisions always include a reputational risk assessment. This risk type is included in climate-related risk assessments through an assessment performed on a continuous basis and is included on our innovation design template. When a new product is developed, the impact on corporate reputation is taken into account. For example, ZX Ventures is our global growth and innovation group whose mandate is to invest in and develop new products and businesses that address emerging consumer needs. We build, launch, and even scale new products that deliver innovative products. An example of a risk of this type is that as stakeholder expectations on how climate change needs to be addressed by organizations change, we need to continue to drive efforts to decarbonize and innovate. An example of this is the implementation of our internal Fiber Policy. Through the fiber policy we addressed the subject of deforestation, committing to eliminate deforestation from our direct supply chain as early as 2023.</td>
</tr>
<tr>
<td>Acute physical</td>
<td>Relevant, always included</td>
<td>We assess physical risks that are event driven. This risk type is included in climate-related risk assessments through evaluating the risk at facilities. Although the probability of severe weather events and frequency happening is hard to predict, an example of a risk of this type is that we have identified sites where weather, such as drought, can affect water availability in the short and long term. We work with the teams across the zones to mitigate this risk. Although the probability of extreme weather events is hard to predict, the impact of these affecting our facilities is estimated to be more than 10 Meg on average.</td>
</tr>
<tr>
<td>Chronic physical</td>
<td>Relevant, always included</td>
<td>We assess the risks associated with longer-term shifts in climate patterns. An example of this risk type is in 2017 we announced a global partnership with leading agri-tech firm Agribas that will enable us to help farmers around the world access better data and predictive insights on long-term climate effects to help better manage crops. This risk type is included in climate-related risk assessments through evaluating the risk of facilities, both when making the decision to build a greenfield or evaluating the risk of long-term climate related disasters, especially on water-stressed areas. An example of a risk of this type is that water scarcity due to climate change could impact our operations more significantly every year and by 2030 we have estimated billions of dollars at risk in over 50 facilities across the world.</td>
</tr>

Company-specific description
The ETS review process will start early next year once the European Climate law setting 2050 carbon neutrality in law has been adopted either this autumn/winter. After the passing of the 2050 carbon neutrality, the EU will increase the 2030 emission reduction targets from the current 40% (compared to 1990) to 50% or 55% reduction to define the pathway to carbon neutrality by 2050. Current ETS system has been calibrated to deliver 40% reduction by 2030 and has to be readjusted. We expect that new sector(s) will be included in ETS, most importantly for us maritime transport sector. This will certainly push maritime transport prices up. There are talks about including the wider transport sector but that most likely won’t be the case but instead the fuel tax for transport will be increased to facilitate decarbonisation of transport, which will likely increase transport costs for us. Currently we have 5 breweries in ETS system and need to buy emission allocations to cover their emissions. At the moment, the allocations are trading at about 25€/allocation and we spent about USD 1.5 Mio in 2019 and 2020 BU was just under USD 2Mio. This we can expect to go up quite considerably by 2030 due to recalibration to make sure ETS is aligned with the increased 2030 targets. Another emerging regulation risk identified is in Mexico where the new environment trading scheme will be implemented starting 2020. This new regulation, which includes the food and beverage sector, will allow sites to emit up to 100,000 tons CO2e. This new scheme can potentially impact for than 3 facilities in the country including our largest brewery in the world. The expected financial impact is unknown until October 2020 when trading price of the allowance will be published.

Are you able to provide a potential financial impact figure?
Yes, an estimated range

Potential financial impact figure (currency)
<Not Applicable>

Potential financial impact figure – minimum (currency)
1300000

Potential financial impact figure – maximum (currency)
3700000

Explanation of financial impact figure
In Europe we were compliant with Phase I the ETS, there is a penalty of 100 Euro per ton CO2 (subject to inflation) if we were not able to report facility emission by the regulatory deadline that are within the annual allowance of emissions. This cost figure was utilized to estimate global impacts of carbon pricing initiatives for our portfolio of facilities. The ETS transitioned into Phase II and the cost for exceeded allowable emissions has remained the same, therefore this estimate remained unchanged. However, as the ETS transitions into Phase III, the total financial impact is estimated to be 1.3 to 3.7 million Euros depending on whether purchased emission rights can be carried from Phase II to Phase III, with a possible gap for our facilities of approximately 245,000 allowances. Currently, we have 5 facilities under the EU ETS. With the Green New Deal, the risk of having more facilities under the scheme exists. In addition to this, we expect other sectors to be included on the scheme, impacting fuel costs such as maritime and road which could potentially impact for than 3 facilities in the country including our largest brewery in the world. The expected financial impact is unknown until October 2020 when trading price of the allowance will be published.

Cost of response to risk
2500000

Description of response and explanation of cost calculation
We actively manage our participation in the EU ETS program and ensure compliance with our regulatory obligations. As a case study example, the company currently has identified six facilities in Europe that are part of the EU ETS (Situation). Our Zone Brewery Support group for Europe is responsible for managing our participation in this program (Task). We will continue our strategy to reduce emissions through energy efficiency and purchase allowances as opportunity and need arises (Action), as we have a potential gap of approximately 245,000 allowances through the end of 2020. The figure for the cost of managing the risk was calculated based on whether we are able to carry emissions rights from Phase II to Phase III, and we have conservatively placed the cost of the management to be the mid-point of 1.3 to 3.7 million Euros cost we may incur in response to this risk. We have implemented energy efficiency projects in a number of our facilities in response to this (Result). For example, we introduced a new patent in 2019 that is estimated to reduce our operational emissions by 5% where implemented. The technology creates gas bubbles without needing a lot of heat and water, reducing energy usage at our breweries as less heat energy is required to brew beer. 34 of our breweries are already equipped with this technology, with 19 more planned for 2019.

Company-specific description
AB InBev is exposed to fuel and energy taxes on energy purchased by the company as well as within its supply chain. Potential risks associated with increases in these types of taxes include higher direct operational costs and supply chain costs that are passed on to the company. The production and distribution of our products require significant amounts of energy, including the consumption of oil-based products, natural gas, biomass, coal and electricity. In the case of AB InBev, Scope 3 emissions represent the highest percentage of total emissions and we focus on working with our suppliers to mitigate risk as it can be reflected on supply prices. In addition to that we identify the risk on our thermal and electric energy separately and focus on specific projects like PPAs and renewable energy to reduce emissions globally. For example, we signed agreements for an equivalent of 1.1GW in renewable electricity in 2019, representing more than 20% of our global consumption. Our partnership with Enel Green Power’s Thunder Ranch in Oklahoma, US went live this year, providing 602,000 MWh of electricity – the equivalent of 11% of AB InBev’s total global electricity consumption. Energy prices have been subject to significant price volatility in the recent past and may be again in the future. High energy prices over an extended period of
time, as well as changes in energy taxation and regulation in certain geographies, may result in a negative effect on operating income and could potentially challenge our profitability in certain markets. There is no guarantee that we will be able to pass along increased energy costs to our customers in every case.

**Potential financial impact figure (currency)**  
<Not Applicable>

**Potential financial impact figure – minimum (currency)**  
0

**Potential financial impact figure – maximum (currency)**  
10000000

**Explanation of financial impact figure**  
Our annual energy costs are close to 1 billion USD. Hypothetically, as an example of the financial implications of increased energy costs associated with energy taxes or regulation, a one percent increase would add approximately 10 million USD to our cost of energy (0.01*1,000,000,000=10,000,000).

**Cost of response to risk**  
10000000

**Description of response and explanation of cost calculation**  
We reduce our risk exposure to fuel/energy taxes and regulation as much as possible by working to lower our energy use. The method we use to manage this risk long term is to take a comprehensive approach to reducing both costs and emissions by improving efficiency, switching to lower emission and more cost-effective fuels, using renewables when feasible, and participating in carbon markets when it aligns with business goals. Our cost of management was calculated by assessing the approximate amount annually dedicated to these projects out of total capital expenditures in 2019 (10,000,000 USD = 2019 efficiency improvements + 2019 lower emission fuels and renewables + 2019 carbon market purchases). As a case study example, we have ambitious goals to reduce our risk through our commitment to brew with 100% renewable electricity by 2025 (Situation). We have set our facilities on the road to achieve this goal (Task). When they have achieved the goal they are adorned with a renewable energy symbol. The symbol was launched in the US and Chile and will be rolled out in other markets around the world by 2025 (Action). Every day, approximately 41 million Budweiser's are sold globally. Transitioning to 100% renewable energy during brewing translates into the equivalent of taking more than 50,000 cars off the road per year for the brand. To date the results have been positive, showing 60% completion (Result). In addition, we set a science-based target to reduce our greenhouse gas emissions by 25% per beverage across our supply chain by 2025, with a baseline of 2017.

**Comment**

Decreased revenues due to reduced demand for products and services

**Climate risk type mapped to traditional financial services industry risk classification**  
<Not Applicable>

**Company-specific description**  
We rely on the reputation of our company and brands. Our success depends on our ability to maintain and enhance our image and reputation. Potential climate-related risks to our company reputation are related to consumer attitude and attention toward climate change and environmental issues in general. If consumers feel that we are not taking action to address climate change, there may be less demand for our products. In 2019 we continue to advance towards our 2025 Sustainability Goals which aim to deliver a measurable, positive impact on the environment and our communities as aligned with the UN Sustainable Development Goals. These goals directly contribute to targets within Climate Action, Renewables, Water Access, Waste and Access to Finance. In addition, we set a Science Based Target to publicly demonstrate our commitment to combating climate change and we continuously participate in key stakeholder events, where we continue to make strategic partnerships may mitigate our reputational risk. We work on engaging our specific brands on different sustainability programs. For example, our global brand Budweiser, continues to champion Climate Action by focusing on renewable electricity. Through the packaging, Budweiser is communicating to consumers when the beer is brewed with renewable electricity with the purpose of creating awareness of low-carbon products in the market to the consumer and help drive change in purchasing behavior.

**Time horizon**  
Long-term

**Likelihood**  
Unlikely

**Magnitude of impact**  
Medium

Are you able to provide a potential financial impact figure?  
Yes, an estimated range

**Potential financial impact figure (currency)**  
<Not Applicable>
Explanation of financial impact figure

The financial implications on reputation for not taking climate-related actions are difficult to quantify. However, inaction could affect our brand value negatively should it result in the decrease of our products sold. To provide a perspective of the financial implications, in 2019, our portfolio of more than 500 beers included seven of the top 10 global beer brands and 19 brands that generated more than 1 billion USD in retail sales per year. Just a 1% decrease in revenue from negative brand value would result in a loss of 532 million USD based on 2019 revenues of 53.2 billion. In addition, we have identified that consumers are products that have a purpose and leave a positive impact in the world as well as transparency. This trend, although hard to measure, has increased over the past 5 years, and actions towards sustainable solutions need to be put in place to meet consumer demands.

Cost of response to risk

70000000

Description of response and explanation of cost calculation

The methods we use to reduce reputational risk include ensuring that the appropriate internal policies, accountability measures, and environmental management systems continue to support these measures, guiding our behavior and performance throughout the company. The systems in place that address this are our ‘10 principles’ that embody our company's culture and our internal (VPO) data management system. The company ensures that its efforts surrounding climate change are clearly and accurately communicated through the use of our annual report and marketing. The company monitors the reflection of attitudes in the marketplace through social media, focus groups and other mechanisms. VPO is a formal data management system that is used from top management through operational levels, for areas such as environment, maintenance, quality, people, health and safety, and logistics. Costs associated with taking action to reduce reputation risk are difficult to estimate for the organization. The figure for the cost of managing the risk was calculated by summing the investments we have made in management systems, outreach and communication efforts, water, and energy projects in 2019 which total approximately 70 million USD. As a case study example, we have used our stakeholder engagement to help improve our supply chain relationships (Situation). Our goal of 100% of our direct farmers will be skilled, connected and financially empowered by 2025 (Task). We have begun the process of working with our direct farmers through our Agricultural Development Programs (Action). As a result, in the 13 countries that we work within over 35,000 farmers have been empowered to ensure full transparency and success of farmers in our direct supply chains (Result).

Resource efficiency

Primary climate-related opportunity driver

Use of more efficient production and distribution processes

Primary potential financial impact

Reduced indirect (operating) costs

Company-specific description

Beverage manufacturing and distribution is an energy-intensive business; with annual energy costs reaching close to 1 billion USD. For that reason, energy conservation and emission reduction are a strategic focus. Our comprehensive approach to managing this critical resource curtails greenhouse gases, mitigates our business risks, and ultimately, enhances our cost effectiveness and competitiveness. To help achieve this, we have adopted disruptive brewing technologies that help reduce emissions significantly while boiling. In 2019, we adopted the Simmer and Strip technology, which was patented by us in 2018, helping increase energy efficiency in over 34 of our facilities across the world. In addition to this, we increase our efforts to implement low-carbon and net zero initiatives through R&D. We are currently testing different technologies in 6 facilities across the world. The potential of reducing Scope 1 emissions through the implementation of these technologies is up to 3 million tons CO2e and close to 1 million Euros in ETS allowances.

Are you able to provide a potential financial impact figure?

Yes, a single figure estimate

Potential financial impact figure (currency)

50000000

Potential financial impact figure – minimum (currency)

<Not Applicable>
Potential financial impact figure – maximum (currency)

<Not Applicable>

Explanation of financial impact figure

Our current energy costs are more than 1 billion USD per year. Improving efficiency can therefore yield significant savings. In 2019 our purchased energy has resulted in a reduction of 6.9% kgCO2 e/hl vs our 2017 baseline of total scope 1, 2 and 3 emissions. Furthermore, we have reduced our Scope 1 and 2 emissions by 13.27% in absolute value and 19.06% in intensity (kgCO2 e/hl) vs our 2017 baseline. Through a rigorous process, we internally share best practices and measure results. In 2019, the value captured was approximately $50 million dollars in decreased energy costs (sum of company-wide savings) due to our implemented energy efficiency projects.

Comment

Strategy to realize opportunity and explanation of cost calculation

We continue working on improving our energy efficiency. As a case study example, we measure and share best practices, benchmarking the 6 zones of the business to understand where the opportunities lie (Situation). Through the process, we are able to quantify the size of the opportunity and return on investment of each initiative. The initiatives, that add up to hundreds of individual activities, are tracked and monitored throughout the 3 following years (Task). These include fuel switch from coal to natural gas (China), implementation of Simmer and Strip Technology (34 facilities across the world) (Action). As a result, in 2019 we reduced our energy purchased in our breweries by 5.21% vs 2018 (Result). The figure for the cost to realize the opportunity was calculated based on the sum cost of implementing our current energy efficiency projects, which total approximately $10,000,000 USD.

Cost to realize opportunity

10000000

Primary climate-related opportunity driver

Development of new products or services through R&D and innovation

Primary potential financial impact

Increased value of fixed assets

Company-specific description

Barley efficiency and seed research programs have been developed to improve crops and help them tolerate extreme weather conditions, such as drought. The company invests in barley research and development in order to create new varieties with better yields and to develop sustainable techniques that help improve the volume and quality of the barley produced by our farmers. These varieties have characteristics, such as disease resistance and drought tolerance that can allow crops to grow in extreme weather conditions. In the long term, this helps us better manage the cost of our raw materials and ensure that we have a source of high-quality raw materials to use in our products. These programs provide us with the additional opportunity of working closely with growers allowing us to also grow and improve our business relationships, including our SmartBarley Benchmarking initiative. In addition to this, we are currently working in partnership with NASA. Through historical and future climate scenarios, we are able to model plausible scenarios and understand the impact climate change can have on barley yield.

Yes, an estimated range

Potential financial impact figure (currency)

<Not Applicable>

Potential financial impact figure – minimum (currency)

0

Potential financial impact figure – maximum (currency)

532000000

Explanation of financial impact figure

After water, barley is the primary ingredient in beer and our key agricultural focus. We source hops, rice and corn as well as local crops such as sorghum and cassava in Africa which we continually assess possible financial risks. Action to secure access to high quality agricultural inputs at a competitive price is essential to the success of our business. The financial implications are difficult to quantify, however improvements in the volume and quality of the barley produced by the farmers could affect revenues. For example, just a 1% increase in revenue of 53.2 billion USD would result in a gain of 532 million USD based on 2019 revenues.

Cost to realize opportunity

2000000

Strategy to realize opportunity and explanation of cost calculation

Our management methods of our agricultural commodities are comprehensive. We are active participant in the UN Environmental Programme, the Beverage Industry Environmental Roundtable, the UN CEO Water Mandate (steering committee) and the Sustainable Agriculture Initiative. For the past six years we have organized a technical advisory group of outside experts to focus on barley water management and watershed protection. The figure for the cost to realize the opportunity was calculated based on the sum cost of our investment on our SmartBarley R&D in support of responsible barley growing practices, which is approximately 2 million USD. As a case study example, our creation of the SmartBarley initiative enables independent growers to use shared data and learn best practices to deliver increased value to their farms and communities (Situation). SmartBarley comprises a portfolio of field level programs that focus on trialing and transferring new crop technologies and improved practices (Task). This initiative has impacted and engaged over 4,500 growers with the goal of cultivating the highest quality barley with the best yields and lowest cost (Action). As a result of our ongoing engagement efforts with growers we have been able to work directly with more than 17,000 barley growers worldwide (Result).

Opp3

Where in the value chain does the opportunity occur?
Direct operations

Opportunity type
Products and services

Primary climate-related opportunity driver
Shift in consumer preferences

Primary potential financial impact
Increased revenues resulting from increased demand for products and services

Company-specific description
We have the opportunity to positively impact our competitiveness by maintaining our reputation as a good corporate citizen. We have identified a shift in packaging preferences and market maturity in the beer industry from one-way packaging to returnable (and recyclable) packaging. In 2019, 40.9% of our portfolio was in returnable packaging. To help protect our returnable mix and satisfy consumer preference towards one-way glass, we issued a challenge on our second cohort of our 100+ Accelerator. We identified 3 start-ups that are helping protect returnables. Examples include Nomo Waste in Colombia where, through waste collectors and cooperatives, we are able to recollect one-way bottles to bring them back to our facilities and refill them as new one-way bottles. By doing this, we are able to reduce the carbon footprint of one bottle by more than 50% in Colombia.

Time horizon

Yes, an estimated range

Potential financial impact figure (currency)
<Not Applicable>

Potential financial impact figure – minimum (currency)
0

Potential financial impact figure – maximum (currency)
10000000

Explanation of financial impact figure
The financial implications on reputation as a benefit of addressing climate change are difficult to quantify. Consumer attitude and attention towards the issue of climate change and the environment in general can create opportunities for companies that are aligned to address those concerns. While it is difficult to quantify, this may be reflected in increased sales as consumers make alternative choices that are more aligned with their concerns and values. We have many areas of opportunity from a consumer perspective. To provide a perspective of the financial implications, our portfolio of more than 500 beers includes seven of the top 10 global beer brands and 18 brands that generate more than 1 billion USD in retail sales per year. An increase in reputation amongst consumers leading to just a 1% increase in sales from one of the 18 worldwide brands that generated more than 1 billion USD in sales last year would be equivalent to $10,000,000 USD. This assumption was utilized to calculate an increased revenue due to brand reputation.

Cost to realize opportunity
6000000

Strategy to realize opportunity and explanation of cost calculation
The methods we use to maintain our reputation as a responsible company include ensuring that the appropriate policies, accountability measures, and environmental management systems supporting these measures guide our behavior and performance are in place. Costs associated with taking action to maintain our reputation as a leading corporate citizen are difficult to estimate in total. They include ongoing investments in our management systems, energy and water programs, outreach and communication efforts, and research conducted to ensure we effectively consider the attitudes of key stakeholders and consumers. A case study example of our reputational efforts, is our support of Water.org through our brand Stella Artois (Situation). Today, 750 mil. people around the world lack access to clean water, something that we wanted to address (Task). In response, Stella Artois developed the ‘Buy a Lady a Drink’ campaign (Action). As a result of this campaign we have donated to Water.org to help provide clean water to more than 1 million people in the developing world annually (Result). The approximate investment as a sum of these water engagement activities is 6 million USD.

Comment

C3. Business Strategy

C3.1

(C3.1) Have climate-related risks and opportunities influenced your organization’s strategy and/or financial planning?
Yes, and we have developed a low-carbon transition plan
(C.3.1b) Provide details of your organization’s use of climate-related scenario analysis.

<table>
<thead>
<tr>
<th>Climate-related scenarios and models applied</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>205</strong></td>
<td>Scenario analysis was identified to inform AB InBev’s GHG reduction targets, which have been developed in conjunction with the Science Based Targets Initiative (SBTi). In December 2017, we signed the commitment to set a Science Based Target, with an understanding of the need for the entire AB InBev organization to work towards contributing their fair share to achieve a 20% by 2030, a time horizon of approximately 30 years. This time horizon is relevant to AB InBev as it aligns with the UN Global Compact. We used an analytical method, called the Sectoral Decarbonization Approach, which was developed by CDP, VRI, and the WEF. The SDA utilizes scenario analysis to determine a carbon budget based on a company’s relative contribution to the economy and uses a least-cost modified below 1.5° C scenario developed by the International Energy Agency (IEA 20DS). The result of this process showed that we could set an ambitious yet realistic target to reduce emissions across the value chain (Scope 1, 2, and 3) by 20% per beverage by 2025, from a 2017 base year and Scope 1 and 2 emissions by 50% in absolute emissions within the same timeframe, and informed our overall GHG strategy as part of ABInBev’s 2025 sustainability goals with a time horizon of approximately 8 years. The areas of your organization that have been considered as part of the scenario analysis include direct, indirect, and supply chain operations across our global organization to reinforce AB InBev’s commitment towards mitigating the impacts of climate change. The results of the scenario analysis informed us that we could achieve an approximate 10% overall total emission reduction if we were to purchase 100% renewable energy at all breweries. This informed our strategy to secure 100% of our purchased electricity from renewable sources by 2025. An example of how the results of the scenario analysis have directly influenced our strategy is through our Power Purchase Agreements (PPA) in place in both Mexico and the United States, where our agreement with Enel Green Power has resulted in the construction of the Thunder Ranch Wind Farm in Oklahoma. Our scenario analysis is in line with our 1.5-degree pathway which has informed company-wide strategy. We considered this result the most robust target possible and it also helps guide long term strategy and reduction beyond 2025. Specifically, the way in which the results of our scenario analysis have directly influenced our business objectives and strategy is that we have adapted our climate strategy to further engage members of our value chain where close to 83% of our emissions lie. We continue enforcing our Eclipse supplier-dedicated platform where we invite supply chain partners to share our Sustainability vision. Eclipse allows us to identify key opportunities for partnership on sustainable development with some of our biggest suppliers across our top markets and encourages target setting and accelerated decarbonization among our suppliers. As a result of these efforts, in November 2019 we held our first Eclipse Summit in St Louis, US where we discussed key sustainability issues including decarbonization strategy and as of December 2019, more than 50 major suppliers signed up.</td>
</tr>
<tr>
<td><strong>RCP 8.5</strong></td>
<td>In order to measure potential risk due to climate change, following TCFD recommendations, we modelled transition and physical risks using the IPCC RCP pathways. RCP 8.5 which suggests a business as usual pathway, with a temperature increase of approximately 5°C, shows a future scenario of the risks our organization would face in a business as usual scenario. Although policy risks are lower in this scenario, market risks, especially those regarding commodities within the supply chain are significant. In the particular case for AB InBev, risks associated to transition risks in market are related to decrease in yield in crops such as barley, wheat, rice, and maize among others. Identified risk and opportunities of Barley yields for growth in the future. Where we should be growing Barley due to the risks found on climate change. Most of the results are promising, in terms of barley yield increase in the areas where we currently grow barley. The model is updated annually, therefore we assess annually and monitor the forecast. Water is a physical risk we monitor as well. We saw that in the next ten years, we saw that physical risk is regardless of the target pathway. Tie is back to the RCP models. Best case scenario, worst case. Both scenarios in terms of physical risk, no difference in the next 10 years. ABInBev make specific. We see positive results such as Northern America and Argentina for barley yields in the next twenty to thirty years. Regarding physical risk, risks related to extreme weather events such as hurricanes, floods, and drought are more likely to occur as well as the severity of these, especially in locations across our coastal regions such as our brewery in the Dominican Republic of Malting site in Cartagena, Colombia. Chronic risks such as water scarcity will increase in the next 10 years, significantly increasing our risk due to water across the world with new emerging geographies that are not stressed today putting billions of dollars at risk.</td>
</tr>
<tr>
<td><strong>RCP 2.6</strong></td>
<td>In order to measure potential risk due to climate change, following TCFD recommendations, we modelled transition and physical risks using the IPCC RCP pathways. RCP 2.6 which suggests a sustainable pathway with emissions declining to zero by 2100, and with a temperature increase below 2°C. In this scenario we model a future and the risks our organization would face. Future risk due to regulation is extremely high, with governments implementing carbon taxes or trading schemes across the world. In the particular case for AB InBev, risks associated with a slower transition to carbon neutral are identified and equivalent to millions of US dollars per year in the different countries. To model this, assumptions based on current regulations and policies in line with “below 2 degrees” were simulated in the top 10 markets across the world to assess the potential risk. Identified risk and opportunities of Barley yields for growth in the future are lower than business as usual but still remain present but with promising results, with barley yield increases in the areas where we currently grow barley. The model is updated annually, therefore we assess annually and monitor the forecast. Water is a physical risk we monitor as well. We saw that in the next ten years, we saw that physical risk is regardless of the target pathway. Tie is back to the RCP models. Best case scenario, worst case. Both scenarios in terms of physical risk, no difference in the next 10 years. ABInBev make specific. We see positive results such as Northern America and Argentina for barley yields in the next twenty to thirty years. Regarding physical risk, risks related to extreme weather events such as hurricanes, floods, and drought are more likely to occur as well as the severity of these, especially in locations across our coastal regions such as our brewery in the Dominican Republic of Malting site in Cartagena, Colombia. Chronic risks such as water scarcity will increase in the next 10 years, significantly increasing our risk due to water across the world with new emerging geographies that are not stressed today putting billions of dollars at risk.</td>

**Products and services**

We recognize the climate-related risks and opportunities may impact our products; if we do not take action to address climate change, there may be less demand for our products. This has been identified as a high risk for our business and therefore has heavily influenced our long-term strategies in this area. Proactively anticipating and reacting to climate-related risks was viewed as an opportunity and has influenced substantial strategic decisions such as in 2018 we set new, more ambitious 2025 Sustainability Goals. In addition to these holistic goals, we set climate-specific goals through our Science Based Target and RE100, further demonstrating our commitment to combating climate change. Budweiser, the largest beer brand in the world, has targeted its strategy, recognizing the importance of climate change, to openly talk about a transition to a low-carbon economy by including a 100% renewable electricity logo in every Budweiser brewed with renewable electricity. In 2019 Superbowl, it announced the shift to renewables in the United States. In addition, AB InBev continuously participates in key stakeholder events, where we continue making strategic partnerships that mitigate our reputational risk. For a case study of the substantial strategic decision, in July 2019 we launched Michelob Ultra Pure Gold in order to mitigate reputational risk and reduce climate-related impacts for farmers. We recognized the importance of organic farming and its impact on sustainability, and in turn announced an initiative to support American barley farmers who wish to reduce their climate-related impacts through transitioning to organic production. AB InBev is helping them navigate the steps required to grow certified organic crops. The results of this campaign resulted in nearly 20 million earned media impressions and grew our brand value. The magnitude of impact of our 2025 goals is felt across our entire business and affects the way we develop new products, distribute our products, and market our products.

**Supply chain and/or value chain**

More than 85% of our emissions lie in our supply chain. We recognize the importance to address our supply chain and accelerated decarbonization. According to TCFD recommendations, risk, due to market such as supply chain risk are latent in our organization. The opportunity we have recognized to influence climate-related risks associated with our supply chain is more efficient production and distribution processes spanning our entire value chain and address our barley, water, energy, packaging, transportation and refrigeration use. The magnitude of the impact is best reflected in our Scope 3 emissions which indicate agriculture is our biggest supply chain risk as it ranks highest in terms of financial impact and uncertainty of event occurring. We have already experienced crop loss and impacts in agriculture supply chains specifically in several of our markets including Brazil and Mexico where we source barley from, representing a significant portion of our total country volume. This has influenced our strategy through emphasizing the importance of our active engagement of our largest suppliers to fulfill our own sustainability goals so we can scale and accelerate impacts. To help achieve this, throughout scenario analysis, modeling historical data and future scenarios using satellite data from NASA, we have been able to quantify financial impacts due to yield decline in the areas where we have barley-growing programs. This analysis provides us with guidance on where we need to continue developing programs and where we should launch new programs in the near- and long-term futures in line with our time horizon for our 2025 Sustainability Goals. The most substantial strategic decision made in this area influenced by the scenario analysis was to create a platform to enable collaboration and joint decarbonization of our supply chain. Eclipse, our supplier-focused collaboration platform, aims to do this. In November 2019, we hosted the first Eclipse Summit in the US where more than 150 procurement professionals and influential leaders came together in St. Louis to discuss critical stakeholders and opportunities. Some of the critical issues discussed center on how quick decarbonization including transportation, ag tech, packaging innovation and recycling infrastructure transformation.

**Investment in R&D**

Both internal and external research and development has been realized as an opportunity to advance our climate-related goals in-line with our time horizon of 2025. The opportunity we have recognized to influence climate-related risks associated with our investment in R&D is more efficient production and distribution processes. We hope that strategically focusing on R&D to reduce our exposure to fuel price volatility will decrease our climate-related risks. Our internal R&D department is focused on decreasing the impacts of climate-related risks through innovation in both our beverage and its associated packaging. We continue to invest in the design of more efficient brewing processes and use of renewable energy sources. Our R&D team is currently working on transforming our current facilities into net zero ones. Capital allocation has been prioritized and projects to achieve success go through the Net Zero Steering Committee that meets 6 times throughout the year. Design of such initiatives is taken into consideration for capital expenditure allocation. Annual strategy is based on this prioritization at a regional and global level. A case study of the most substantial strategic decision is our green logistics campaign. Through the program, we are empowering drivers and committed entrepreneurs and leverage use our vast resources and expertise for the opportunity to scale and accelerate business opportunities. Successful pilots, which we invest in initially, are further scaled up with opportunity of additional funding. Following a lean startup bootcamp, mentoring sessions and on-the-ground pilots, the first cohort demonstrated their pilot results during a Demo Day during 2019 Climate Week in New York City where select startups pitched their solutions to investors. 12 of the startups have signed commercial contracts with our business outside of the 100+ Accelerator pilot. Their solutions are being implemented across the globe.

**Operations**

The opportunity we have recognized to influence climate-related risks associated with our operations is through positively impacting our competitiveness. The strategy that we have developed to realize this opportunity is actively maintaining our reputation as a good corporate citizen. This strategy has directly influenced our ‘10 principles’ that embody our company’s dream and culture and are reflected within our data management system. In addition to this, we hold once a year an internal process in order to prioritize operation projects. This process prioritizes projects that deliver both financially and promise reduction in terms of both energy efficiency and emission reduction. This prioritization is taken into consideration for capital expenditure allocation. Annual strategy is based on this prioritization at a regional and global level. A case study of the most substantial strategic decision is our green logistics campaign. One action we took as part of the campaign was the removal of 20,000 trucks off Belgian roads in 2019 with the launch of a new “beer boat” to ship Stella Artois from Liège to Antwerp. As a case study, climate-related risks and opportunities have influenced how we make strategic decisions on capital expenditures/capital allocation based on performance of risk assessments associated with each country we have operations in (Stibaution). Through this we have realized that our capital expenditure and capital allocation have been impacted by emerging regulations. For example, we have allocated capital resources to reduce our risk from emerging climate-related regulations (Task). Between 2018 and 2019 (Time Horizon) we invested more than 100 million USD to implementation of new technology in more than 30 of our facilities (Action). As a result, that has saved 5% on annual emissions at a brewery level (Result).

(C3.1e) Describe where and how climate-related risks and opportunities have influenced your financial planning.

<table>
<thead>
<tr>
<th>Financial planning elements that have been influenced</th>
<th>Description of influence</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Revenue</strong></td>
<td>As of 2019, our revenue at AB InBev has not been impacted by climate-related risks/opportunities. We continuously assess the market and long-term trends to understand consumer and market future risks and opportunities which we have identified are continuously shifting preference towards sustainable and purpose driven products. This preference gains more relevance every day, which we believe can potentially shift our consumer preferences. As our products are made from natural ingredients, it is our responsibility to protect the environment where we operate. Our revenue for 2019 was $22.3 billion USD which could be impacted significantly due to climate change as resources become scarcer. Our products are made from natural resources, and if the right measures are not in place, raw material availability (barley, cassava, maize, soya, among others) can affect our bottom line. However, we do not anticipate an impact on revenue to occur in the near future and if it occurs, we expect the impact to be low, less than 1 percent. As consumer preferences shift to more purpose driven products, we see the need to develop brands that champion climate-related topics. Examples include Patagonia which in 2019 launched in the United States with a campaign to save CO2 emissions by being brewed locally. In addition, Patagonia partnered with the National Forest Foundation to responsibly plant 1 tree for every beer purchased. Another example is Skol, who champions 0 waste on every carnival and event in Brazil, educating consumers on the importance of recycling and circular economy. As a case study, climate-related risks and opportunities influence how we make strategic decisions on capital expenditures/capital allocation based on performance of risk assessments associated with each country we have operations in (Stibaution). Through this we have realized that our capital expenditure and capital allocation have been impacted by emerging regulations. For example, we have allocated capital resources to reduce our risk from emerging climate-related regulations (Task). Between 2018 and 2019 (Time Horizon) we invested more than 100 million USD to implementation of new technology in more than 30 of our facilities (Action). As a result, that has saved 5% on annual emissions at a brewery level (Result).</td>

Supplier engagement has helped us reduce emissions in the last 2 years by: decreasing emissions of packaging and malting specifically. In addition to this, we have engaged with cooler suppliers which has helped us reduce our scope 3 emissions significantly and make up for negative externalities encountered in other processes along the value chain.

Comment
In the United States we have implemented efficiency projects such as collaborative transportation, helping us reduce empty mileage across the country. This initiative is being piloted in other countries across the organization and we are partnering with suppliers across our supply chain through Eclipse, by having a third party who can help identify opportunities for collaboration and reduce empty mileage across the country which today accounts for 20% of total mileage in the US.
(C4.3c) What methods do you use to drive investment in emissions reduction activities?

<table>
<thead>
<tr>
<th>Method</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Employee engagement</td>
<td>Employees are continuously engaged and challenged to develop water and energy efficiency initiatives through our data management system and other formal best practice sharing programs. In addition, we use special events such as a rallying point and to generate additional activities. Every year, on World Environment Day, we recognize the zone that has set an example on energy usage. In addition to this, employees are encouraged to participate as mentors on the 100+ Accelerator, providing guidance and expertise to the different start-ups in the program.</td>
</tr>
<tr>
<td>Internal incentives/recognition programs</td>
<td>Energy targets are linked to compensation for many employees throughout the company. We reinforce and incentivize their performance by tying the compensation of many employees to the achievement of our environmental goals. In addition, best practices are recognized at the regional and global levels through a variety of communications and formal recognition events. Our internal data management system allows us to share goals, data, progress, and best practices across the company. By tracking and documenting this information, these systems enable us to provide internal incentives and recognition programs throughout our operations. Internally we set energy purchased targets and we have reduced this KPI by 5% from 2017 to 2019. In addition, carbon reduction targets are set at every level in the organization, from C-suite to site manager level.</td>
</tr>
<tr>
<td>Partnering with governments on technology development</td>
<td>We are leveraging technology to transform ways of working to be more agile so we can create better solutions and value for our customers and our consumers around the world. For example, in In Africa, we invested $90 million (5.3 million USD) in a Research and Development Center that will enable our world-class research and training to benefit farmers and the agricultural sector as a whole. The center officially opened in September with an event attended by 300 delegates from government, research institutions, industry bodies and farmers. In Idaho, we are working in partnership with local stakeholders (including the U.S. Department of Agriculture) to scale an irrigation scheduler program, called Agrilight, linking local climate station data to a web and mobile application that delivers accurate evapotranspiration and other climate parameters, allowing growers to better optimize their irrigation water management. In Mexico, we are collaborating with the federal program MaAgrO and industry association Centros Impulsores, among others, to advance the use of nitrogen sensors in the Bajio region for improving fertilizer use efficiency. We have an additional project in Mexico in the Alto Plano region designed to improve irrigation efficiency. In China, we conducted large-scale irrigation trials in partnership with the state supported Gansu Academy of Agriculture Sciences (E), to identify optimal irrigation practices for select varieties in the province. Grower Demonstrations were held throughout the season to discuss the trials, review results and promote best irrigation practices.</td>
</tr>
<tr>
<td>Other (Setting goals)</td>
<td>Setting clear, integrated goals that cascade throughout our organization drives investment in emissions reduction activities to which we hold people accountable. In 2018 we launched our 2025 Sustainability Goals, our most ambitious set of sustainability commitments yet, focused on smart agriculture, water stewardship, circular packaging and climate action. As IPCC recommendations were updated in December 2018, we also updated our Science-Based target in order to be in line with the most ambitious pathway of 1.5 degrees and we continue to advance on our renewable electricity commitment, closing 2019 with over 60% of total beer volume contracted, and 20% operational.</td>
</tr>
<tr>
<td>Dedicated budget for low-carbon product R&amp;D</td>
<td>Our innovation center works continuously in developing cutting edge technologies that reduce our emissions and energy usage on our facilities. In 2018, we launched the 100+ Sustainability Accelerator by issuing ten challenge statements across a range of issues, including water stewardship, farmer productivity, product upcycling, responsible sourcing, green logistics and more. Our goal was to solicit applications from startups that are solving key sustainability challenges with innovative solutions. Through the program, we want to empower driven and committed entrepreneurs and use our vast resources and expertise to nurture, support and grow these budding businesses. We were recognized among Fast Company’s World-Changing Ideas 2019 and Forbes’ inaugural Blockchain 50 list for our partnership with BanQu, a startup from our 100+ Sustainability Accelerator, which helps provide financial identities to unbanked farmers in Uganda and Zambia.</td>
</tr>
<tr>
<td>Other (Investing in emerging technologies)</td>
<td>Our Research and Development (GITEC) team unveiled a new digital printing technology that imprints branding onto the bottles directly, eliminating the need for paper or plastic labels and providing potential environmental and economic benefits. To launch the initiative, we released 200,000 bottles of a limited-edition run of Beck’s Artist Series. In addition to this, we are investing in emerging technologies that can help disrupt brewing and ways of obtaining heat energy. We are currently piloting different technologies across 6 facilities in the world, implementing agile methodology to emission reduction.</td>
</tr>
</tbody>

<td>Knowledge sharing</td>
<td>In 2019 we continued to support our farmers in our approach to agricultural development, working with over 20,000 farmers in 13 countries to support the growth of our six priority crops (barley, cassava, hops, maize, rice, sorghum) and increase their resilience to climate change.</td>
</tr>
</tbody>
</table>

Primary climate change-related benefit

Increasing resilience to climate change (adaptation)

Estimated CO2e savings (metric tons CO2e)

0

Please explain

The 2019 crop year proved to be challenging in many growing regions across the globe, with weather events threatening both quality and yield. Whether it was rain at harvest or drought during critical growth periods, climate change continues to increase the intensity and frequency of these potentially devastating weather events. Increasing farmer resilience and reducing production volatility through improved breeding and crop management practices will continue to be a focus for our Research and Agronomy teams. We are working diligently to ensure our framework of “skilled, connected, and financially empowered” appropriately supports farmers to adopt the practices and tools they need to address the challenges they face in their local environments. We have partnered with Cool Farm Alliance and NASA to measure emissions on our facilities and we share learnings and best practices on the table with other consumer goods companies that are part of the forum.

(C4.5) Do you classify any of your existing goods and/or services as low-carbon products or do they enable a third party to avoid GHG emissions? Yes
C4.5a

(C4.5a) Provide details of your products and/or services that you classify as low-carbon products or that enable a third party to avoid GHG emissions.

Level of aggregation
Group of products

Description of product/Group of products
We have significantly grown the share of renewable energy used to brew our Budweiser products in the United States. Specifically, the brand has been able to decrease its operational GHG footprint by close to 40%.

Are these low-carbon product(s) or do they enable avoided emissions?
Low-carbon product and avoided emissions

Comment
As we move as an organization towards carbon neutrality there is an ongoing shift of our breweries, such as those for Budweiser, to optimize and reduce energy consumption. Our strategy is anchored on a clear roadmap of technology and smart processes that will transform our operations over the next ten years. As technology is evolving constantly, we are always scouting, developing and validating new technologies at big scale production to strengthen and improve our technology pipeline. We are currently testing different technologies in 6 facilities across the world. As brewing beer is a delicate process, it is necessary to guarantee taste and quality of the final product.

C6.4

(C6.4) Are there any sources (e.g. facilities, specific GHGs, activities, geographies, etc.) of Scope 1 and Scope 2 emissions that are within your selected reporting boundary which are not included in your disclosure?

Yes

C6.4a
(C6.4a) Provide details of the sources of Scope 1 and Scope 2 emissions that are within your selected reporting boundary which are not included in your disclosure.

**Source**
Minor facilities and business office sites, such as sales offices

**Relevance of Scope 1 emissions from this source**
Emissions are not relevant

**Relevance of location-based Scope 2 emissions from this source**
Emissions are not relevant

**Relevance of market-based Scope 2 emissions from this source (if applicable)**
Emissions are not relevant

**Explain why this source is excluded**
Operations of minor facilities and business offices use very low amounts of energy in comparison to other operations (less than 1% of total emissions, which was calculated on the Quantis tool when submitting the Science Based Target). Collecting and reporting this data would require a large effort that would have little impact on our goals, overall reduction efforts or reported emissions.

---

C6.5

(C6.5) Account for your organization’s gross global Scope 3 emissions, disclosing and explaining any exclusions.

**Purchased goods and services**

**Evaluation status**
Relevant, calculated

**Metric tonnes CO2e**
15937148.68

**Emissions calculation methodology**
Methodology used: GHG Protocol Corporate Value Chain (Scope 3) Standard This includes estimated emissions from Agriculture, Malting and Adjunct processing, and packaging materials. These emissions have been calculated based on both custom and industry emission factor averages. Input includes tons of raw materials and packaging materials as well as geography were raw materials were grown or sourced from. We also take into account the recycled content in our primary packaging.

**Percentage of emissions calculated using data obtained from suppliers or value chain partners**
80

**Please explain**
Emissions from purchased good and services are calculated using a hybrid approach, meaning a combination of market averages and supplier-specific data. For agriculture, data coming from our direct farmers. For other materials, a combination of supplier specific data that is collected through the CDP Supply Chain program in collaboration with our suppliers and market emission factor averages, results of LCA studies, is calculated. To estimate emissions from packaging better, we also input recycled content which is collected directly from suppliers.

**Capital goods**

**Evaluation status**
Not relevant, explanation provided

**Metric tonnes CO2e**
<Not Applicable>

**Emissions calculation methodology**
<Not Applicable>

**Percentage of emissions calculated using data obtained from suppliers or value chain partners**
<Not Applicable>

**Please explain**
These emissions do not contribute significantly to value chain emissions (estimated at less than 5% of total value chain emissions), and do not contribute significantly to the company's risk exposure. The company also has very limited influence over capital goods emissions. This was determined via an exercise to set the operational boundary of value chain emissions calculations.

**Fuel-and-energy-related activities (not included in Scope 1 or 2)**

**Evaluation status**
Relevant, calculated

**Metric tonnes CO2e**
967949

**Emissions calculation methodology**
IPCC Guidelines for National Greenhouse Gas Inventories

**Percentage of emissions calculated using data obtained from suppliers or value chain partners**
100

**Please explain**
Emissions associated with fuel and energy related activities not included in Scopes 1 and 2 include emissions from Transfer and Distribution (T&D) from grid electricity and well-to-tank (WTT) emissions associated with fuels combusted in the manufacturing process.
Upstream transportation and distribution

Evaluation status
Relevant, calculated

Metric tonnes CO2e
390953.69

Emissions calculation methodology
GHG Protocol Corporate Value Chain (Scope 3) Standard Data is compiled using an internal collection system where distance (KM) data are provided by the zones on a monthly basis, by transportation mode and flow. Emission factors are provided per transport mode and energy by the zones and are sourced from US EPA’s Smartway program or DEFRA. Emissions in tons of CO2e are estimated by multiplying the distance driven (converted to liters of fuel) and appropriate emission factor. We include road, rail, and sea transport.

Percentage of emissions calculated using data obtained from suppliers or value chain partners
20%

Please explain
Emissions from upstream transportation and distribution is calculated based on the tonnage of raw materials purchased. Transport of ingredients and packaging materials is done either in vessels (ships) or road transportation. Specific emission factors are taken into consideration to calculate emissions by distance traveled.

Waste generated in operations

Evaluation status
Not relevant, explanation provided

Metric tonnes CO2e
<Not Applicable>

Emissions calculation methodology
<Not Applicable>

Percentage of emissions calculated using data obtained from suppliers or value chain partners
<Not Applicable>

Please explain
These emissions do not contribute significantly to value chain emissions (estimated at less than 5% of total value chain emissions), and do not contribute significantly to the company’s risk exposure. This was determined via an exercise to set the operational boundary of value chain emissions calculations. We recycle more than 99% of waste generated in our breweries.

Business travel

Evaluation status
Not relevant, explanation provided

Metric tonnes CO2e
<Not Applicable>

Emissions calculation methodology
<Not Applicable>

Percentage of emissions calculated using data obtained from suppliers or value chain partners
<Not Applicable>

Please explain
Business travel emissions do not contribute significantly to Scope 3 emissions (estimated at less than 1% of total Scope 3 emissions), and do not contribute significantly to the company’s risk exposure. Therefore, they are deemed negligible and not relevant.

Employee commuting

Evaluation status
Not relevant, explanation provided

Metric tonnes CO2e
<Not Applicable>

Emissions calculation methodology
<Not Applicable>

Percentage of emissions calculated using data obtained from suppliers or value chain partners
<Not Applicable>

Please explain
These emissions do not contribute significantly to Scope 3 emissions (estimated at less than 1% of total Scope 3 emissions), and do not contribute significantly to the company’s risk exposure.

Upstream leased assets

Evaluation status
Not relevant, explanation provided

Metric tonnes CO2e
<Not Applicable>

Emissions calculation methodology
<Not Applicable>

Percentage of emissions calculated using data obtained from suppliers or value chain partners
<Not Applicable>

Please explain
The company owns no upstream leased assets that are relevant to the inventory.
Downstream transportation and distribution

**Evaluation status**
Relevant, calculated

**Metric tonnes CO2e**
241,116,23

**Emissions calculation methodology**
GHG Protocol Corporate Value Chain (Scope 3) Standard Data is compiled using an internal collection system where distance (KM) data are provided by the zones on a monthly basis, by transportation mode and flow. Emission factors are provided per transport mode, tier and energy by the zones and are sourced from US EPA's Smartway program or DEFRA. Emissions in tons of CO2e are estimated by multiplying the distance driven (converted to liters of fuel) and appropriate emission factor. We include road, rail, and sea transport.

**Percentage of emissions calculated using data obtained from suppliers or value chain partners**
100

**Please explain**
We have scaled our efforts to more than 90% of our operating markets and are working to standardize tracking and management systems globally. While capturing accurate estimates of carbon initiatives across global operations is complicated, we are focusing our efforts to achieve consistency in our measurement and reporting tools. Distribution emissions are tracked through our Green Logistics program.

Processing of sold products

**Evaluation status**
Not relevant, explanation provided

**Metric tonnes CO2e**
<Not Applicable>

**Emissions calculation methodology**
<Not Applicable>

**Percentage of emissions calculated using data obtained from suppliers or value chain partners**
<Not Applicable>

**Please explain**
There is no processing of sold products within our value chain processes. Once our products are packaged, they are ready for consumption by the consumer.

Use of sold products

**Evaluation status**
Relevant, calculated

**Metric tonnes CO2e**
62,188,065.55

**Emissions calculation methodology**
GHG Protocol Corporate Value Chain (Scope 3) Standard These emissions relate to trade refrigeration of our products. Emission factors have been used based on assumptions of both energy use and refrigeration emissions from the cooling our products in trade. Input includes volume sold and on/off trade volume distribution in each country around the world.

**Percentage of emissions calculated using data obtained from suppliers or value chain partners**
50

**Please explain**
Approximately 50% of our volume is cooled on the coolers we installed in the market. For such, we use the energy consumption data provided by supplier partner and alongside grid emission factors, we estimate emissions from cooling. The remaining 50% is calculated using market averages from studies developed for cooling.

End of life treatment of sold products

**Evaluation status**
Relevant, calculated

**Metric tonnes CO2e**
55,842,861

**Emissions calculation methodology**
GHG Protocol Corporate Value Chain (Scope 3) Standard. Emissions are calculated based on recycling rates and recycled content in each country we operate in and emission factors of each of the packaging materials we utilize in our process.

**Percentage of emissions calculated using data obtained from suppliers or value chain partners**
90

**Please explain**
Recycling rates of various packaging materials are taken into consideration to estimate emissions from end of life. Of our products, only packaging materials remain after the product has been consumed. We continue our efforts on increasing recycled content and maintaining returnables to reduce end of life impact on our value chain.
Downstream leased assets

**Please explain**
These emissions come from growing of raw ingredients including barley, rice, maize, and other commodities we use for production of our products; from processing of raw ingredients like processing from barley to malt; and from manufacturing of packaging material like cans, glass bottles, PET, steel, fiber, and other relevant packaging material we use to pack our product. The methodology used to calculate these emissions is in line with the Technical Guidance for Calculating Scope 3 Emissions developed by the World Resources Institute and WBCSD and the Agriculture Guide.

(C-AC6.8/C-FB6.8/C-PF6.8) Is biogenic carbon pertaining to your direct operations relevant to your current CDP climate change disclosure?

No

(C-AC6.9/C-FB6.9/C-PF6.9)
Do you collect or calculate greenhouse gas emissions for each commodity reported as significant to your business in C-AC0.7/FB0.7/PF0.7?

### Agricultural commodities

**Rice**

Do you collect or calculate GHG emissions for this commodity?

Yes

**Please explain**

We calculate emissions data using the hybrid method of market averages and supplier emissions. We gather the volume purchased across all our operations in the world in tons and use this weighted average by geography to estimate emissions from rice. In 2019, 1.3 million tons CO2e where related to rice agriculture. We are currently working in the United States, our biggest rice purchasing country, to measure, track, and minimize the environmental impact of rice in the agricultural supply chain in partnership with Indigo.

**Other (Barley)**

Do you collect or calculate GHG emissions for this commodity?

Yes

**Please explain**

We estimate emission factor data via our Smart Barley program, where we work with more than 20,000 direct farmers. The data is collected through surveys, and with the help of Cool Farm Tool, we are able to estimate emissions related to growing and harvesting barley. Using these emission factors, which are calculated at a local level, along the information of global purchases at a country level, we are able to estimate emissions from barley. In 2019, 1 million tons CO2e correspond to emissions from barley agriculture. At AB InBev, barley is our most critical crop, and we are currently measuring future risk and opportunity using satellite data and NASA future scenario data.

**Other (Maize)**

Do you collect or calculate GHG emissions for this commodity?

Yes

**Please explain**

We calculate emissions data using the hybrid method of market averages and supplier emissions. We gather the volume purchased across all our operations in the world in tons and use this weighted average by geography to estimate emissions from rice. In 2019, 430,000 tons CO2e where related to maize agriculture.

**Wheat**

Do you collect or calculate GHG emissions for this commodity?

Yes

**Please explain**

We calculate emissions data using the hybrid method of market averages and supplier emissions. We gather the volume purchased across all our operations in the world in tons and use this weighted average by geography to estimate emissions from rice. In 2019, 2,000 tons CO2e where related to wheat agriculture.
Report your greenhouse gas emissions figure(s) for your disclosing commodity(ies), explain your methodology, and include any exclusions.

**Rice**

Reporting emissions by
Total

Emissions (metric tons CO2e)  
1329742.803

Denominator: unit of production  
<Not Applicable>

Change from last reporting year  
Higher

Please explain  
Emissions coming from commodities was calculated using a mix of supplier-specific data and market averages based on geographic location and type of commodity. Estimates include life cycle analysis and include yield, fertilizer use, and sequestration. Rice is recognized as one of the most carbon intensive crops and as such, we are working on mitigating the impact through partnerships like the one with Indigo in the United States. Through these types of initiatives, we are able to track and monitor environmental KPIs such as fertilizer and water usage on our Jonesboro milling plant.

Direction of change
Decreased

Reason for change
AB inBev continues to pursue low carbon energy investments. For example, in 2019 in Argentina we celebrated becoming the first consumer goods company in the country to commit to 100% renewable electricity in 2020, to be supplied by the Budweiser Wind Park. We also signed renewable electricity contracts in 100% of pan-European countries and Dominican Republic, 30% of volume in Brazil, and 20% of volume in Colombia. We are also on the path to be powered with 100% of renewable electricity by 2021 in the United States, participating in one of the 5 largest solar projects in the world. On-site solar keeps playing a major role in countries like China and South Africa where we have achieved 20-25% renewable electricity in the 5 facilities where it’s been installed. In terms of heat energy (Scope 1), we have reduced our energy usage by 5% since 2017. Through the implementation of energy efficiency projects and changing the way we brew beer; we have been able to advance faster on our 2025 commitment to reduce absolute Scope 1 and 2 emissions by 35%.

Do you include emissions pertaining to your business activity(ies) in your direct operations as part of your global gross Scope 1 figure?
Yes

Select the form(s) in which you are reporting your agricultural/forestry emissions.
Total emissions

Report the Scope 1 emissions pertaining to your business activity(ies) and explain any exclusions. If applicable, disaggregate your agricultural/forestry by GHG emissions category.

Activity
Processing/Manufacturing

**C7.9**
(C7.9) How do your gross global emissions (Scope 1 and 2 combined) for the reporting year compare to those of the previous reporting year?
Decreased

(C7.9a) Identify the reasons for any change in your gross global emissions (Scope 1 and 2 combined), and for each of them specify how your emissions compare to the previous year.

<table>
<thead>
<tr>
<th>Change in emissions (metric tons CO2e)</th>
<th>Direction of change</th>
<th>Emissions value (percentage)</th>
<th>Please explain calculation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change in renewable energy consumption</td>
<td>567070 Decreased</td>
<td>10</td>
<td>Several of the renewable electricity contracts previously contracted between 2017 and 2018 came live in 2019. Some examples include Budweiser Park in Argentina which will increase renewable electricity from 18% in 2019 to 100% in 2020 as it came live in late 2019. Other examples are Vietnam and India, where on-site solar projects were connected, accounting for almost 1,000 tons CO2e. Our biggest contributor in reduction was the United States with 383,000 tons CO2e due to fuel switch initiatives, especially Thunder Ranch renewable electricity. Through these activities we reduced our emissions by 567070 tons CO2e, and our total S1 and S2 emissions in the previous year was 5897840 tons CO2e, therefore we arrived at -10% through (-567070/5897840) * 100 = -10% (i.e. an 10% decrease in emissions).</td>
</tr>
<tr>
<td>Other emissions reduction activities</td>
<td>167208 Decreased</td>
<td>3</td>
<td>We manage our energy purchased (both heat and electricity) through our internal systems and employees have metrics tied to compensation. Emission reduction activities include implementation of new boiling technologies like Simmer and Strip, which was patented by AB InBev in early 2018. This technology helps reduce emissions by 5% in breweries where implemented. Another example was implementing High efficiency boilers in facilities across the world and eliminating leakages in some of our facilities in Asia Pacific. In addition, implementation of different initiatives like LED lights in our facilities and other process optimizations like reduction of evaporation rates during boiling. Calculation is based on energy utilized by facility. Through these activities we reduced our emissions by 167208 tons CO2e, and our total S1 and S2 emissions in the previous year was 5897840 tons CO2e, therefore we arrived at -3% through (-167208/5897840) * 100 = -3% (i.e. a 3% decrease in emissions).</td>

C8.2e

(C8.2e) Provide details on the electricity, heat, steam, and/or cooling amounts that were accounted for at a zero emission factor in the market-based Scope 2 figure reported in C6.3.

**Sourcing method**
Power purchase agreement (PPA) with a grid-connected generator with energy attribute certificates

**Low-carbon technology type**
Wind

**Country/region of consumption of low-carbon electricity, heat, steam or cooling**
Argentina

**MWh consumed accounted for at a zero emission factor**
35396.36

**Comment**
We were the first Consumer Goods company to contract 100% of our volume on renewable electricity. The project went live on October 2019 but starting 2020, 100% of the electricity will come from renewable resources. The wind park was named “Budweiser Park” to honor the brand championing the transition to renewables.

**Sourcing method**

**Low-carbon technology type**
Solar

**Country/region of consumption of low-carbon electricity, heat, steam or cooling**
China

**MWh consumed accounted for at a zero emission factor**
29152.89

**Comment**
In 2019, we installed the largest on-site solar installation on our Putian facility in China which makes the facility around 20% renewable. Afterwards, in partnership with Yushuo and the 100+ Accelerator, we piloted an energy storage solution made from used e-car batteries. Renewable electricity in the facility went up by around 50%. Yushuo, part of our first Accelerator cohort, has received external funding from partners like The World Bank among others.

**Sourcing method**
Green electricity products (e.g. green tariffs) from an energy supplier, not supported by energy attribute certificates

C9. Additional metrics
C9.1 Provide any additional climate-related metrics relevant to your business.

**Description**

**Waste**

**Metric value**

**Metric numerator**
Tons of total primary packaging material recycled

**Metric denominator (intensity metric only)**
Tons of total primary packaging material

**% change from previous year**
46%

**Direction of change**
Increased

**Please explain**

Our 2025 goals are aligned to UN SDGs. Our Circular Packaging Goals which includes protecting our returnable packaging and increasing recycled content in our primary packaging including glass, cans, and PET. In 2019, we increased recycled content in PET from 15.7% in 2018 to 23% in 2019. In partnership with key suppliers, we have implemented collection projects in countries like Brazil and Colombia. In Colombia specifically, we partnered with local schools to collect used PET bottles from our brand Pony Malta, recovering more than 2,000 tons of material.

**Description**

**Waste**

**Metric value**

**Metric numerator**
Tons of primary packaging material recycled

**Metric denominator (intensity metric only)**
Tons of total primary packaging material

**% change from previous year**
3%

**Direction of change**
Increased

**Please explain**

Our 2025 goals are aligned to UN SDGs. Our Circular Packaging Goals which includes protecting our returnable packaging and increasing recycled content in our primary packaging including glass, cans, and PET. In 2019, we increased recycled content in glass by 1% point. Recovering glass has proven to be challenging in many geographies but we are making progress. In Mexico, we are partnering with NGO partners like ECOCE, who help us recover glass from the waste stream. In 2019, we piloted a start-up in our 100+ Accelerator cohort called Green Mining. By formalizing the recycling infrastructure, green mining was able to collect ore than 550,000 tons of glass, avoiding these to go to waste, reducing GHG emissions in Brazil, and increasing recycling rates in glass.

Comment
Carbon Tax for South Africa will take effect in 2020. Cost is currently being assessed internally.

C11.1d

(C11.1d) What is your strategy for complying with the systems you are regulated by or anticipate being regulated by?

As a case study example, the company currently has five facilities in Europe that are part of the EU ETS. Our Zone Brewery Support group for Europe has been tasked with managing our participation in this program and ensuring compliance with our regulatory obligations and our participation in the market is managed by Ab-InBev procurement department. As in previous years, for our surrender obligation we had a surplus of allowances. Our strategy is to surrender a portion of our emissions rights. Going forward, we will continue our compliance strategy to reduce emissions through energy efficiency and purchase allowances as opportunity and need arises, and as a result we have a potential gap of approximately 245,000 allowances through the end of 2020. Another one of our action plans has been putting up a taskforce to transform existing technologies into net zero carbon technologies.

C11.2
(C11.2) Has your organization originated or purchased any project-based carbon credits within the reporting period? 
No

(C11.3) Does your organization use an internal price on carbon? 
No, but we anticipate doing so in the next two years

C12. Engagement

C12.1

(C12.1) Do you engage with your value chain on climate-related issues? 
Yes, our suppliers
Yes, our customers
Yes, other partners in the value chain
(C12.1a) Provide details of your climate-related supplier engagement strategy.

**Type of engagement**
Innovation & collaboration (changing markets)

**Details of engagement**
Run a campaign to encourage innovation to reduce climate impacts on products and services

**% of suppliers by number**
80

**% total procurement spend (direct and indirect)**
90

**% of supplier-related Scope 3 emissions as reported in C6.5**
90

**Rationale for the coverage of your engagement**
Although a very small number of suppliers make up the majority of the procurement spend, we engage with all suppliers on climate related issues. We are focusing on key suppliers that will move the needle and make a change, for AB InBev that means a small number of suppliers and we engage in strategic meetings quarterly to touch on sustainability issues facing both parties. Suppliers include primary packaging (glass, aluminum, and PET), raw materials, and commercial suppliers (coolers, sponsorships, promotional material among others).

**Impact of engagement, including measures of success**
Our biggest impact in emissions lies on our value chain and as such, we recognize the importance of collaboration and joint action. That is why we created Eclipse. Eclipse is AB InBev’s collaboration platform, with over 50 suppliers signed up. In 2018, we launched the site and in November 2019, we held our first Eclipse Summit which will be followed by other events in different geographies across the world. The purpose of the Summit was to celebrate suppliers that have gone the extra mile, awarding International Paper the Eclipse award for most sustainable project of the year. We also discussed key topics that are relevant for our shared supply chains. One project that came out of those discussion is the metal cups that were executed at the Superbowl, reducing waste at the event. In addition, as one of the world’s largest purchasers of glass bottles and aluminum cans, we continue to champion a circular economy. Through our 2025 Packaging Goal, our measure of success is to have 100% of our products be in packaging that is returnable or made from majority recycled content.

**Comment**
Our supplier engagement platform, Eclipse (www.eclipse.ab-inbev.com) is targeted to all suppliers and partners. To date we have more than 50 suppliers signed up with a pledge and in addition, key partners and NGOs that are helping us in providing resources and tools to our suppliers.

---

**Type of engagement**
Information collection (understanding supplier behavior)

**Details of engagement**
Collect climate change and carbon information at least annually from suppliers

**% of suppliers by number**
30

**% total procurement spend (direct and indirect)**
80

**% of supplier-related Scope 3 emissions as reported in C6.5**
80

**Rationale for the coverage of your engagement**
Although a very small number of suppliers make up the majority of the procurement spend, we engage with all suppliers on climate related issues. As we continue to perfect the process with existing suppliers, we will expand our requests.

**Impact of engagement, including measures of success**
Every year, we are inviting our key suppliers to report on CDP Climate and Water, understanding the importance of transparency. We also educate our suppliers on CDP and reporting plus the information that we most look into such as renewable energy consumption and emissions, especially those related to Scopes 1 and 2.

**Comment**
CDP Supply Chain

C12.1b
(C12.1b) Give details of your climate-related engagement strategy with your customers.

**Type of engagement**
Collaboration & innovation

**Details of engagement**
Run a campaign to encourage innovation to reduce climate change impacts

**% of customers by number**
30

**% of customer-related Scope 3 emissions as reported in C6.5**
30

**Portfolio coverage (total or outstanding)**
<Not Applicable>

Please explain the rationale for selecting this group of customers and scope of engagement

Packaging is our biggest contributor to our carbon emissions, representing more than one third of our carbon footprint across the value chain. To help tackle this, we are engaging with our retailer partners. One way we are doing this is through our two-way packaging (returnable bottles and kegs) and protecting and promoting returnable packaging continues to be our biggest opportunity.

**Impact of engagement, including measures of success**
The impact of this engagement with our retail partners is significant. Measures of success include an increase in percent of returnable packaging, an increase in percent of cans and glass and a decrease in percent of PET, as well as an increase in recycled content in our packaging portfolio. In 2019, 40.9% of our volume was in returnable packaging, down from 46% in 2017. We plan to reverse this trend and protect this operating model through consumer norm campaigns, innovations, and new ways of working with our retailer partners. In addition to this, we work closely with our retailer partners across the world, reaching them the value of installing ECO-coolers and the environmental benefit it brings to everyone. Since 2017, through our new cooler installations and refurbishments, we have been able to save over 700,000 tons of CO2e, significantly contributing to our 2025 goal. Cooling represents 20% of our Scope 3 emissions.

---

(C12.1d) Give details of your climate-related engagement strategy with other partners in the value chain.

Our stakeholder engagement aims to help improve our relationships with other members of the value chain. We allocate resources annually and developed an external facing initiative: the 100+ Sustainability Accelerator where we engage with startups. Through the Accelerator, ten challenge statements are issued across a range of issues, including water stewardship, farmer productivity, product upcycling, responsible sourcing, climate action, green logistics and more. Through the program, we are empowering driven and committed entrepreneurs and leverage use our vast resources and expertise to nurture, support and grow these budding businesses. Successful pilots, which we invest in initially, are further scaled up with opportunity of additional funding.

Following a lean startup bootcamp, mentoring sessions and on-the-ground pilots, the first cohort demonstrated their pilot results during a Demo Day during 2019 Climate Week in New York City where select startups pitched their solutions to investors. 12 of the startups have signed commercial contracts with our business outside of the 100+ Accelerator pilot. Their solutions are being implemented across the globe and brands like Corona, Goose Island, Leffe and Jupiler have supported some of the projects. We launched our second round of applications in October for piloting in 2020 and we received over 1,200 applications from over 30 countries (compared to 650 applications from 20 countries in 2018). So far, the startups in our cohorts have jointly addressed 15 out of the 17 UN Sustainable Development Goals. The 100+ Accelerator and our startups have earned awards and recognition from Fortune, Fast Company, Ethical Corporation Responsible Business and Financial Times Intelligent Business Awards.

C-AC12.2/C-FB12.2/C-PF12.2

(C-AC12.2/C-FB12.2/C-PF12.2) Do you encourage your suppliers to undertake any agricultural or forest management practices with climate change mitigation and/or adaptation benefits?

Yes

---

C-AC12.2a/C-FB12.2a/C-PF12.2a
Specify which agricultural or forest management practices with climate change mitigation and/or adaptation benefits you encourage your suppliers to undertake and describe your role in the implementation of each practice.

**Management practice reference number**

MP1

**Management practice**

Knowledge sharing

**Description of management practice**

AB InBev partners with growers around the world to produce high-quality malt barley. Through 2017, more than 7000 growers have participated in SmartBarley, utilizing the program to compare their crop performance against advanced productivity and key environmental performance metrics from similar growers and global benchmarks. The information within SmartBarley also helps our local teams identify the most pressing challenges facing our growers, helping direct our portfolio of initiatives to address those challenges that most influence grower productivity, resource use efficiency and profitability, develop improved varieties with higher barley yields and increased water efficiency, and assist growers in the art of producing malt barley.

**Your role in the implementation**

Financial

**Explanation of how you encourage implementation**

In Mexico, AB InBev developed three new barley varieties which provide increased yields and incomes for farmers. Creating Conecta Modelo, a pilot project with 150 barley farmers in Mexico that use mobile devices to receive climate, market and technical information. Providing farmers with access to newer farm equipment by financing 100% of the cost. Utilizing technology to optimize fertilizer use. Additionally, in 2019, we rolled out a new and improved SmartBarley app to provide better tools for our 100+ agronomists to advise farmers around the world and developed training programs focusing on both technical and financial skills for farmers in multiple countries (i.e., India, Tanzania, Uganda and Mexico), working with key partners including TechnoServe and FIRA.

**Climate change related benefit**

Increasing resilience to climate change (adaptation)

Governmental or institutional policies and programs

**Description of management practice**

We are dedicated to enhancing water access and security for people and ecosystems across our markets through watershed restoration and conservation programs.

**Your role in the implementation**

Financial

**Explanation of how you encourage implementation**

In 2019, we continued to scale our water stewardship efforts by engaging in watershed protection partnerships with local stakeholders, focusing on high stress areas across Argentina, Bolivia, Brazil, China, Colombia, Mexico, Peru, South Africa, the United States and Zambia. Together with local authorities, other water users and NGOs such as the World Wide Fund for Nature (WWF) and The Nature Conservancy (TNC), we invested financial and technical resources into green infrastructure initiatives, conservation and reforestation projects, habitat restoration efforts and soil conservation techniques. Through these initiatives, we are increasing water security and improving water quality and availability for our communities and operations.

**Climate change related benefit**

Increasing resilience to climate change (adaptation)

**Comment**

MP3

**Management practice**

Other, please specify (Water management)

**Description of management practice**

We have worked with local barley farmers to provide the advice and support needed to make a valuable difference to water use in their communities.

**Your role in the implementation**

Financial

**Explanation of how you encourage implementation**

We have worked directly with farmers to help institute better farming practices in South Africa. Through guidelines for sustainable barley production we developed with WWF-South Africa, we have helped farmers increase the resilience, productivity and economic value of their crop while reducing environmental impact. By using precision irrigation of barley, the amount of water used to grow malting barley was cut in half, from 117mm to 58mm per ton in two years, while improving productivity. We look forward to taking our learnings from programs like these to other water-stressed regions in Africa and beyond.

**Climate change related benefit**

Increasing resilience to climate change (adaptation)

C-AC12.2a/C-FB12.2a/C-PF12.2a
Do you collect information from your suppliers about the outcomes of any implemented agricultural/forest management practices you have encouraged?

Yes

Do you engage in activities that could either directly or indirectly influence public policy on climate-related issues through any of the following?

Direct engagement with policy makers
Trade associations
Other

On what issues have you been engaging directly with policy makers?

<table>
<thead>
<tr>
<th>Focus of legislation</th>
<th>Corporate position</th>
<th>Details of engagement</th>
<th>Proposed legislative solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clean energy generation</td>
<td>Support</td>
<td>We are active members of RE100 and part of the eight-member advisory committee where we engage with other renewable electricity leaders and discuss key topics such as legislation and opportunities that identify gaps worldwide. We are also REBA members which drives best practices on clean energy generation.</td>
<td>We support the legislation related to these groups with no exceptions.</td>
</tr>
</tbody>
</table>

Are you on the board of any trade associations or do you provide funding beyond membership?

Yes

Enter the details of those trade associations that are likely to take a position on climate change legislation.

<table>
<thead>
<tr>
<th>Trade association</th>
<th>Is your position on climate change consistent with theirs?</th>
<th>Please explain the trade association’s position</th>
<th>How have you influenced, or are you attempting to influence their position?</th>

</thead>
<tbody>
<tr>
<td>British Beer &amp; Pub Association</td>
<td>Consistent</td>
<td>Provide an industry perspective to regulators, such as UK DEFRA, on the impacts of proposed regulations related to climate change.</td>
<td>We have provided feedback to the association on the potential impacts of proposed climate change rules and regulations on our breweries.</td>
</tr>
<tr>
<td>Beverage Industry Environmental Roundtable (BIER)</td>
<td>Consistent</td>
<td>Consistent BIER recognizes that there are considerable opportunities to improve energy efficiency across beverage sector operations and works to achieve acceptable standards through benchmarking and best practice sharing around energy accounting, key performance indicators and transparency. Through the allied voice of BIER, members collaborate to monitor and inform the development of climate change policy initiatives and work to ensure policy compliance through common guidance for calculating, tracking and reporting carbon impacts within the beverage sector. BIER released a joint commitment on climate change on behalf of its members in May 2015. We support BIER’s joint commitment on climate change through activities and target setting and we are active in the organization itself, attending meetings and working to advance environmental sustainability in the beverage sector.</td>
<td>We support BIER’s joint commitment on climate change through activities and target setting and we are active in the organization itself, attending meetings and working to advance environmental sustainability in the beverage sector.</td>
</tr>
</tbody>
</table>
(C12.3e) Provide details of the other engagement activities that you undertake.

The company’s method of engagement with policy makers on possible responses to climate change occurs primarily through active participation in industry and trade associations as well as global corporate social responsibility commitments. For example, we have committed to securing 100% of our purchased electricity from renewable sources by 2025. This commitment enabled us to join RE100, a collaborative global initiative uniting more than 100 influential businesses committed to using 100% renewable electricity.

Additionally, the company is an active participant in the Brewers of Europe Environmental Committee and the Beverage Industry Environmental Roundtable (BIER), both of which are engaged in energy and climate policy issues. We have also served on the EIUG (Energy Intensive Users Group) Council in previous years in South Africa. In May 2015, BIER released a joint commitment on climate change on behalf of its members. The commitment includes managing supply chain water risk, reducing agricultural water footprint, and conserving water. In addition, signatories to the commitment support an international framework of rational GHG reduction targets and commitments to invest in adaptation. In 2010, the Brewers of Europe Environmental Workgroup helped determine methodologies for free allocations of emissions rights for the brewing sector in Phase III. In addition, the brewing sector submitted several position papers regarding carbon footprinting. At a country level, we participate in trade working groups that work to evaluate and influence climate change policy. Examples of this include our membership in the Belgian Food Federation where we worked on energy covenants in Belgium and the British Beer Association working on the Climate Change Agreement in the U.K. We also provide feedback and comment on potential impacts and opportunities to proposed legislation and act as an advocate for behavioral principles, such as the United Nations Global Compact (UNGC), the UN CEO Water Mandate and AIM-Progress (responsible sourcing). The nature of the engagement occurs on national and international levels and includes providing input to policy makers through trade associations on an emerging policy issue, or through public communication of our commitment to acting on climate change. The actions that we advocate include informing policy makers about industry challenges and opportunities regarding climate change and working with other companies to develop industry approaches to address key climate change challenges. At the local level, our facilities engage local leaders on a variety of natural resource conservation issues in order to promote conservation in the community, as well as inside our own facilities and to promote efficiency at all levels. As an example, in Belgium we are participating in and funding “Leuven Climate Neutral by 2030.” This effort includes CO2 footprint studies of the city and the development of action plans aimed at reducing CO2 emissions. Leuven Climate Neutral encompasses multiple sectors of society, including city government, residential households, agriculture, industry and transportation. We also participate in the “Lean & Green” program, sponsored by the Flemish Institute for Logistics, Belgium, to reduce energy consumption through implementing logistics efficiency best practices.

(C12.3f) What processes do you have in place to ensure that all of your direct and indirect activities that influence policy are consistent with your overall climate change strategy?

Processes are in place to ensure that all of our direct and indirect activities that influence policy are consistent with our overall climate change strategy. These processes include implementation of our VPO management system, which ensures a consistent approach to our climate engagement activities across business divisions and countries, and the distribution of Common Positions across the company. Common positions on climate change strategy are also discussed at global meetings and as normal course during monthly performance reviews with global groups and zones. VPO drives Supply (production and logistics) business strategy across AB InBev. Our performance-based, metric-oriented culture of accountability and integration ensures our activities are consistent with our overall climate change strategy. The company’s key climate-related issues (e.g. water and energy) are incorporated into VPO. Monthly phone calls between Global and Zone Supply include discussion of environmental policy issues that could impact our business. In addition, the Executive Board of Management (EBM) and task force operate as cross-functional teams helping ensure strategic alignment with regards to not only climate change reduction targets, public policy and communications, but other key relevant issues, such as legal and supply chain, for example. In addition, position papers on climate change issues are updated annually and widely distributed to ensure consistency among outreach and messaging at the global, zone and local levels.

(C12.4) Have you published information about your organization’s response to climate change and GHG emissions performance for this reporting year in places other than in your CDP response? If so, please attach the publication(s).

C13. Other land management impacts

C-AC13.1/C-FB13.1/C-PF13.1
Do you know if any of the management practices implemented on your own land disclosed in C-AC4.4a/C-FB4.4a/C-PF4.4a have other impacts besides climate change mitigation/adaptation?
Yes

Management practice reference number
MP2

Overall effect
Positive

Which of the following has been impacted?
Biodiversity
Soil
Water

Description of impact
We have achieved positive impacts through our programs aimed at enhancing water access and security for people and ecosystems. Through these efforts we have promoted soil conservation.

Have you implemented any response(s) to these impacts?
Yes

Description of the response(s)
Together with local authorities, other water users and NGOs such as the World Wide Fund for Nature (WWF) and The Nature Conservancy (TNC), we invested financial and technical resources into green infrastructure initiatives, conservation and reforestation projects, habitat restoration efforts and soil conservation techniques.

Management practice reference number
MP3

Overall effect
Positive

Which of the following has been impacted?
Soil
Water

Description of impact
Our knowledge sharing activities have helped farmers learn better water management practices.

Have you implemented any response(s) to these impacts?
Yes

Description of the response(s)
By using precision irrigation of barley in Africa, the amount of water used to grow malting barley was cut in half; from 117mm to 58mm per ton in two years. In addition, our process optimization improved productivity. We look forward to taking our learnings from programs like these to other water-stressed regions in Africa and beyond.

Do you know if any of the management practices mentioned in C-AC12.2a/C-FB12.2a/C-PF12.2a that were implemented by your suppliers have other impacts besides climate change mitigation/adaptation?
Yes
Management practice reference number
MP2

Overall effect
Positive

Which of the following has been impacted?
Yield

Description of impacts
Through our programs aimed at educating farmers on best practices, we have optimized crop yields of our suppliers.

Have any response to these impacts been implemented?
Yes

Description of the response(s)
AB inBev collaborated with crop nutrition experts in Yara to develop crop nutrition protocols that help farmers grow to meet the high-quality standards for Budweiser while at the same time reducing their costs and limiting environmental impact.
